1849.] 203

The Committee to which was referred the following paper by Prof. Haldeman reported in favor of publication in the Proceedings.

On several new Hymenoptera of the genera Ampulex, Sigalphus, Chelonus and Dorylus.

#### BY S. S. HALDBEAM,

### AMPULEX Jurine.

§ Discoidal nervure having its origin near the posterior extremity of Romand's subdiscoidal recurrent nervure (discoidal of Shuckard), it curves forward and terminates in the cubital nervure beyond the lat transverse-cubital near the middle of the 2d cubital area.

A. PRESYLVANIOUS Hald. Black, somewhat glossy, sparsely punctulate; antennes fuscous; mandibles and tibiæ dull rufous, tarsi paler: pronotum with the medial line impressed; alæ hyaline, external third dusky but becoming colorless towards the apex and centre, basal third varied with rale dusky: metanotum exarate, with 9 longitudinal ridges, between which there are short transverso sulci: abdomen polished. 5 lines long, expanse about the same.

Inhabits woods, taken in S. E. Pennsylvania in September. On account of the obliquity of the median recurrent nervure (Romand), the interior angles of the 1st discoidal and 1st cubital are acute, and similar. Radial and cubital nervures nearly parallel, the latter rectilinear.

# SIGALPHUS Latr.

## (TRIASPIS Haliday.)

S. TIBIALIS Hald. Dark fuscous: head, disk of the thorax, middle of the 1st and 2d segments of the tergum, exserted ovipositor, beneath and feet, flavous; eyes black; antennæ flavous, base and apex pale fuscous; vertex, a mucula behind the eyes, and the posterior tibiæ and knees, fuscous. 2 lines long. S. B. Pennsylvania. The flavous portion of the abdomen extends from the base to the 2d impressed transverse line.

### CHELONUS Jurine.

§ Eyes with hairs; 3 cubital areæ, 2d triangular, with the external apex truncate; abdomen coalite, without sutures.

CH. BASILARIS Say. Bost. J. Nat. Hist. 1, 266. S. E. Pennsylvania, in June. CH. SOBRIMUS. Hald. Black, scabrous: abdomen with a subbasal flavous fascia interrupted in the middle; surface minutely scabrous with a tendency to become sulcate towards the base; antennæ dark fuscous with the two basal articulations rufous: palpi and feet pale flavous; medial femora, and apex of the tibiæ pale fuscous; posterior coxæ, femora and tibiæ (except the base of both) dark fuscous: tarsi obscure toward the apex, posterior ones entirely so. 2 lines long. S. E. Pennsylvania, in June.

§ Eyes with hairs, 3 entire areæ, 2d irregular, abdomen coalite with 1 indistinct suture; metathorax with a spine upon each side.

CH. LUNATUS Hald. Black, scabrous, basal third of the abdomen pale flavous; tergum with numerous longitudinal sulci: mandibles and basal articulation of the antennæ rufous: feet flavous, apex of the tarsi black; exterior half of the

posterior femora and of the tibiæ black: stigma black, nervures fuscous. 3 lin. long. S. E. Pennsylvania, in June.

The abdomen has a single transverse impressed line near the base, beyond which the flavous color extends in a convex lunar form.

### DORYLUS Fabr.

§ Abdominal peduncle hemispherical, nearly the size of the succeeding segment; mandibles incurved, antennæ short.

D. PLANCIPES Hald. Glossy helvolus, fulvose pilose; wings faintly tinged; mandibles, base of antennæ, ocelli and feet rufous; eyes dark and prominent; hair long upon the head, thorax, apex and peduncle of the abdomen; mandibles wide at base, but narrowed upon the inside from the middle to the apex, which is well incurved, with the apex sharp and black. Long. 10, expanse 15, mandibles 1, antennæ 2 lines.

Presented to the Acad. Nat. Sci. by Dr. T. S. Savage, who brought it from Cape Palmas, W. Africa. The feet are very short and the femora much compressed. The antenne are slender, subulate, with 14 articulations, of which the last is not readily distinguishable, the basal one is about one-third the entire length.

On leave granted, a paper was presented from Prof. S. F. Baird, of Carlisle, Penn., entitled, "Revision of the North American tailed-Batrachia, with descriptions of new genera and species," which being intended for publication in the Journal of the Academy, was referred to a committee, viz., Drs. Bridges, Hallowell and Leidy.
