

SUMMARY

A taxonomic description is given of males, females, larvae, and pupae of *Haemagogus* mosquitoes stemming from females captured in the *H. capricornii* type area, Horto Florestal da Serra da Cantareira, State of São Paulo, Brazil.

Evidence is presented for believing that the material described represents the species originally designated by Lutz as *capricornii*.

ACKNOWLEDGMENTS

We wish to extend our thanks to Dr. Mary B. Waddell and her technician Mr. Isaltino R. Soares, of the Laboratório do Servico de Estudos e Pesquisas sobre a Febre Amarela, for rearing the larvae and imagoes from eggs deposited by the females, and to Mr. Lério Gomes for collecting the parent females.

LEPTOTHORAX LONGISPINOSUS SUBSP. IOWENSIS, NOM. N.
(Hymenoptera, Formicidae)

By WILLIAM F. BUREN

The name *Leptothorax longispinosus* subsp. *laeviceps* Buren (*Iowa State College Jour. Science*, 18 (3): 277-312, 1944) is a homonym of *Leptothorax exilis* var. *leviceps* Emery (1898, Ofvers af Finska Vetensk. Soc. Fordandl. 20:11). *Leptothorax longispinosus* subsp. *iowensis*, nom. n. is therefore proposed for the Iowa insect.
